

Modular Arithmetic

Today's content

1. $\%$ operator
2. Modular arithmetic
3. One hard problem

Range

$$\text{int } x : [-2 \times 10^9, 2 \times 10^9]$$

$$\text{long } y : [-9 \times 10^{18}, 9 \times 10^{18}]$$

$\%$ Basics (modular basics)

$n \% a$ = remainder when n is divided by a

$$r = \text{dividend} - (\text{greatest mul. of } a \leq \text{dividend})$$

$$10 \% 4 = 2 = 10 - (\text{greatest mul. of } 4 \leq 10) \\ = 10 - 8 = 2$$

$$13 \% 5 = 3 = 13 - 5 \times 2 = 3$$

$$\text{remainder} = \text{dividend} - \underbrace{\text{divisor} \times \text{quotient}}_{\substack{\downarrow \\ \text{greatest multiple} \\ \text{of divisor} \leq \text{dividend}}}$$

$$150 \% 11 = r$$

$$r = 150 - (\text{greatest mul of } 11 \leq 150)$$

$$11 \times 13 = 143$$

$$11 \times 14 = 154 > 150$$

$$= 150 - 143 = 7$$

$$100 \% 7 = r$$

$$r = 100 - (\text{greatest mul of } 7 \leq 100)$$

$$100 - 98 = 2$$

$$7 \times 14 = 98$$

$$-40 \% 7 = r$$

$$r = -40 - (\text{greatest mul of } 7 \leq -40)$$

$$7 \times -5 = -35 > -40$$

$$7 \times -6 = -42$$

$$= -40 - (-42)$$

$$= -40 + 42 = 2$$

$$-60 \% 9 = 8$$

$$\begin{aligned} 8 &= -60 - (\text{greatest mul of } 9 \leq -60) \\ &= -60 - (-63) \\ &= -60 + 63 = 3 \end{aligned}$$

Modulo always returns a positive value.

Why %?

% limits the input data to required range
 \rightarrow Hashing : {coming class}

$$\left. \begin{array}{l} +\infty \\ 14 \\ 289 \\ 2581 \\ 20 \\ -\infty \end{array} \right\} \% 10 = \begin{array}{l} 4 \\ 9 \\ 9 \\ 1 \\ 0 \end{array} = [0, 9]$$

$$\left. \begin{array}{l} -\infty \\ +\infty \end{array} \right\} \% p = [0, p-1]$$

Modular Arithmetic

$$\begin{array}{c} [0, p-1] \\ (a+b) \% p \end{array} = \begin{array}{c} [0, p-1] \quad [0, p-1] \\ \uparrow \quad \uparrow \\ [a \% p + b \% p] \end{array} \Rightarrow [0, 2p-2] \quad \times$$

$$(a+b) \% p = [a \% p + b \% p] \% p \Rightarrow [0, p-1]$$

$$p=10 \quad a=29, b=13$$

$$(29+13) \div 10 = 42 \div 10 = 2$$

$$[29 \div 10 + 13 \div 10] \div 10 = [9 + 3] \div 10 = 12 \div 10 = 2$$

$$(a \times b) \div p \stackrel{[0, p-1]}{=} \stackrel{[0, p-1]}{a \div p} \times b \Rightarrow [0, (b-1)b] \quad \times$$

$$= (a \div p \times b \div p) \quad \times$$

$$\boxed{(a \times b) \div p = (a \div p \times b \div p) \div p} \Rightarrow [0, p-1]$$

$$\left. \begin{array}{l} (a-b) \div p \\ (a/b) \div p \end{array} \right\} \rightarrow \text{Advanced Batch}$$

$$a=23 \quad b=15 \quad p=5$$

$$(23 \times 15) \div 5 = 375 \div 5 = 0$$

$$(23 \div 5 \times 15 \div 5) \div 5 = (3 \times 0) \div 5 = 0 \div 5 = 0$$

CHECK?

$$1. \underbrace{(a \div p) \div p}_{\substack{\rightarrow [0, p-1] \\ \rightarrow [0, p-1]}} \equiv a \div p \rightarrow [0, p-1] \quad \checkmark$$

$$2. \begin{array}{ccc} (a \div p \times b) \div p & \equiv & (a \times b) \div p \\ \downarrow & & \downarrow \\ (a \div p \div p \times b \div p) \div p & & (a \div p \times b \div p) \div p \\ (a \div p \times b \div p) \div p & \swarrow & \end{array} \quad \checkmark$$

Quiz, Number not divisible by 3?

231, 4562, 7821, 1026

sum of digit should be multiple of 3

$$4+5+6+2 = 17 \div 3 = 2 \neq 0$$

$$2+3+1 = 6 \div 3 = 0$$

$$7+8+2+1 = 18 \div 3 = 0$$

$$1+0+2+6 = 9 \div 3 = 0$$

Proof for $\% 3$ \rightarrow sum of the digits

$$\begin{aligned}(2475) \% 3 &= (2 \times 10^3 + 4 \times 10^2 + 7 \times 10^1 + 5 \times 10^0) \% 3 \\&= \left[(2 \times 10^3) \% 3 + (4 \times 10^2) \% 3 + (7 \times 10^1) \% 3 + (5 \times 10^0) \% 3 \right] \\&= [(2 \times 1) \% 3 + (4 \times 1) \% 3 + (7 \times 1) \% 3 + (5 \times 1) \% 3] \% 3\end{aligned}$$

observations :

$$= [2 + 4 + 7 + 5] \% 3$$

$$10^0 \% 3 = 1$$

$$10^1 \% 3 = 1$$

$$10^2 \% 3 = 1$$

$$10^3 \% 3 = 1$$

\vdots

Proof for $\% 4$ \rightarrow last 2 digits

$$(2457) \% 4 \Rightarrow 57 \% 4 = 1$$

$$(2457) \% 4 = \left[(2 \times 10^3) \% 4 + (4 \times 10^2) \% 4 + (5 \times 10^1) \% 4 + (7 \times 10^0) \% 4 \right]$$

observations $= [50 + 7] \% 4$

$$10^0 \% 4 = 1$$

$$10^1 \% 4 = 2$$

$$\boxed{10^2 \% 4 = 0}$$

$$10^3 \div 4 = 0$$

⋮

Proof for $\div 8$ \rightarrow last 3 digits

$$10^2 \div 8 = 2 \neq 0$$

$$(2457) \div 8 \Rightarrow (457) \div 8$$

$$\begin{array}{|l} 10^3 \div 8 = 0 \\ 10^4 \div 8 = 0 \\ \vdots \end{array}$$

Proof for $\div 9$ \rightarrow sum of the digits

$$10^0 \div 9 = 1$$

$$10^1 \div 9 = 1$$

$$10^2 \div 9 = 1$$

$$10^3 \div 9 = 1$$

⋮

$$(2475) \div 9 = (2+4+7+5) \div 9$$

Divisibility Rule

$\swarrow \searrow$
2 & 3

\rightarrow 70000

Question 1

Given a, n, p . Calculate $a^n \% p$ without inbuilt function.

Constraints: $1 \leq a \leq 10^9$, $2 \leq p \leq 10^9$
 $1 \leq n \leq 10^5$

$$a^n \% p = (a \times a \times a \dots \text{-- } n \text{ times } a) \% p$$

```
int ans = 1
```

```
for (i = 0; i < n; ++i) {
```

~~X~~

```
    ans = ans * a;
```

```
}
```

→ after the for loop

```
return ans % p;
```

$ans = a^n$

$$= (10^9)^{10^5}$$

Overflow

$$= 10^{9 \times 10^5}$$

long: 9×10^{18}

what if $p = 1719855$

Can't use divisibility rule

$$ans = (a \times a \times a \dots \times a) \% p$$

$$= ((a \% p) \times (a \% p) \times \dots) \% p$$

~~int~~ ^{long} ans = 1

for (i = 0; i < n; ++i) {

ans = (ans * a) % p

}
return ans

[0, p-1]

[0, p-1]

✓

p = 10⁹

10⁹ × 10⁹ = 10¹⁸ ^{max value}

TC: O(N)

SC: O(1)

Question 2

Given a number in an array format .

Calculate a[i] % p. → each a[i] represents a single digit of a number.

Constraints:

- $1 \leq N \leq 10^5$
- $0 \leq a[i] \leq 9$
- $2 \leq p \leq 10^9$

eg

N = 5

a[5] =

6	2	3	4	5
---	---	---	---	---

↓

(62345) % 49

p = 49

Idea 1: Convert $a[] \rightarrow$ number
and take $\% p$

$$N=2 : \quad \underline{99} \quad = 10^2 - 1$$

$$N=3 : \quad \underline{999} \quad = 10^3 - 1$$

\vdots

$$N=10^5 : \quad \underline{10^{10^5} - 1}$$

\hookrightarrow storing in int/long
not possible

Hint: Calculate modulo digit by digit

	0	1	2	3	4	
$a[] =$	6	2	3	4	5	$\% p$
	\downarrow	\downarrow	\downarrow	\downarrow	\downarrow	
					$(5 \times 10^0) \% p$	
					$+ (5 \times t) \% p \rightarrow t = 1$	
				$(4 \times 10^1) \% p$		
				$+ (4 \times t) \% p \rightarrow t = (t \times 10) \% p = 10^1 \% p$		
			$(3 \times 10^2) \% p$			
			$+ (3 \times t) \% p \rightarrow t = (t \times 10) \% p = 10^2 \% p$			
		$(2 \times 10^3) \% p$				
		$+ (2 \times t) \% p \rightarrow t = (t \times 10) \% p = 10^3 \% p$				
	$(6 \times 10^4) \% p$					
	$+ (6 \times t) \% p \rightarrow t = (t \times 10) \% p = 10^4 \% p$					

Code

```
def arrmod (a[], p) {
```

```
    n = a.length
```

```
    int long ans = 0
```

```
    int long t = 1
```

```
    for (i = n-1; i >= 0; --i) {
```

```
        int x = (t * a[i]) % p
```

Max values
 $\Rightarrow 9 \times (p-1) = 9 \times 10^9$

```
        ans = (ans + x) % p
```

$\Rightarrow 10^9 + 10^9 \approx 2 \times 10^9$

```
        t = (t * 10) % p
```

$\Rightarrow 10^9 \times 10 = 10^{10}$

```
    }
```

```
    return ans
```

TC: $O(N)$

SC: $O(1)$

}

a = 1345

p = 20

$$\text{ans} = (0 + 5) \% 20 = 5$$

$$\text{ans} = (5 + 4 \times 10) \% 20$$

$$= (5 + 40 \% 20) \% 20 = 5 \% 20$$

$$\text{ans} = (5 + (3 \times 100) \% 20) \% 20$$

$$= (5 + 0) \% 20 = 5$$
